

FOR INDIA'S SCHOOL TEACHERS

The Indian Teacher's AI Classroom Playbook

78 copy-paste prompts and a complete weekly system to cut your lesson planning, question-paper, worksheet and grading work from hours to minutes.

Built for CBSE, ICSE and State Boards · Classes 3 to 12

Verified against the 2026-27 CBSE Computational Thinking & AI curriculum, NEP 2020, DIKSHA and NISHTHA.

DIGITAL EDITION

This is not a book about what AI might do one day. It is a working manual for the teacher who has a syllabus to finish, 45 students in a room, a stack of answer sheets on the table, and a question paper due on Monday.

Across the next pages you get three things. First, the plain facts about what changed in Indian school education for 2026-27, so you know what you are being asked to do and why. Second, a set of free tools that already work in India, with their real prices in rupees. Third, and this is the heart of the book, more than seventy-five ready prompts you can copy, paste and edit to produce lesson plans, question papers, worksheets, feedback and parent messages in minutes instead of hours.

Every prompt follows one simple idea: give the AI your board, your class, your chapter and the format you want. When you do that, the output is usable. When you do not, you get generic filler. The playbook trains you to give that context without thinking about it.

How to use it

Do not read it cover to cover in one sitting. Read Chapter 1 and 2 today to understand the shift and set up your free tools. Then pick the chapter that matches your biggest time sink this week — lesson plans, question papers or grading — and run two or three prompts. The 30-day rollout plan in Chapter 16 tells you exactly what to do in which week.

A note on honesty

AI is a fast first-draft machine, not a final authority. It will occasionally get a formula, a date or a chapter sequence wrong. This playbook shows you, at every step, what to check before the output reaches a student. Treat the AI as a bright but over-confident junior colleague whose work you always read before you sign it.

Contents

1	The 2026-27 shift every Indian teacher must know
2	Your free AI toolkit in India, with real rupee prices
3	The four-part prompt formula that actually works
4	The assessment vocabulary you need
5	Lesson planning: 10 prompts, hours to minutes
6	Question papers and assessments: 14 prompts
7	A worked example: a full Class 10 Science paper
8	Worksheets and differentiated learning: 8 prompts
9	Grading, feedback and report cards: 6 prompts
10	Parent communication and admin: 6 prompts
11	Teaching Computational Thinking & AI (Classes 3-8): 10 prompts
12	Multilingual classrooms with Bhashini: 6 prompts
13	Subject-by-subject: what AI does best for each
14	Growing your own career with AI
15	The seven rules of responsible use
16	The 30-day rollout plan
17	Troubleshooting and FAQs
	Quick prompt index and sources
A	Appendix A: Set up in 10 minutes
B	Appendix B: Limited internet and shared devices
C	Appendix C: Your own admin, records and school duties
D	Appendix D: The weekly rhythm and a printable planner
E	Appendix E: 12 bonus prompts for the teacher's own work
F	Appendix F: The ten most common prompt mistakes
G	Appendix G: A complete lesson plan, generated
H	Appendix H: Myths about AI in Indian classrooms
I	Appendix I: The one-page cheat sheet

1. The 2026-27 shift every Indian teacher must know

The single most important change for you this year is that Artificial Intelligence and Computational Thinking became part of the school curriculum itself, from the primary classes upward. This is not a pilot in a few schools. It is a national change, and the teacher is at the centre of it.

AI and Computational Thinking are now a curriculum, not an optional club

On 1 April 2026 the Union Education Minister launched the CBSE Curriculum on Computational Thinking (CT) and Artificial Intelligence (AI) for Classes III to VIII, to be implemented from the 2026-27 session. CBSE issued the formal circular the same day. The curriculum is built on NEP 2020 and the National Curriculum Framework for School Education 2023, and it is deliberately platform-neutral, meaning it is not tied to one company's tool.

The design is phased and the hours are fixed. For Classes 3 to 5, Computational Thinking is embedded inside the subjects children already study, with about 50 hours of focused work a year. For Classes 6 to 8, the load rises to about 100 hours a year, split as 40 hours of advanced computational thinking, 20 hours of introductory AI concepts, and 40 hours of interdisciplinary projects. In other words, for a middle-school teacher this is not a side activity. It is a real part of your weekly plan.

The higher classes changed too

CBSE also made a clean break for older students. All earlier AI courses running up to 2025-26 for Class IX stand discontinued from 2026-27. Class X continues with the previous scheme. For Classes 9 to 12, NCERT provides modules on CT and AI that are transacted as part of internal assessment. So even if you teach senior classes, you now have AI content to run.

Teacher training is part of the plan, not an afterthought

The Ministry of Education has built teacher capacity-building into the rollout. NISHTHA, the national teacher training programme, carries dedicated modules on AI in Education and digital pedagogy, and it is delivered through DIKSHA, the national school-education platform. As of mid-2026, DIKSHA hosts more than 350 live courses, of which about 59 are on Artificial Intelligence and digital learning. NCERT also runs AI awareness, ethical-AI and AI-tools training. In short, the system expects you to use AI — the question is only whether you use it well.

The exam pattern rewards understanding, and AI helps you build it

The way you are assessed has not changed for 2026-27, but it is demanding. For the board classes, roughly half of each theory paper is competency-focused, about a fifth is multiple-choice, and the rest is short and long constructed response. Questions increasingly drop the student into an unfamiliar situation and ask them to apply, analyse and justify. CBSE kept the question-paper design and assessment pattern unchanged for 2026-27, and released the Class 10 and Class 12 sample papers with marking schemes on 21 September 2026. Writing good competency-based questions is exactly the kind of work AI speeds up — once you know how to ask.

50 hrs

Per year, Classes 3-5

Computational Thinking embedded in core subjects

100 hrs

Per year, Classes 6-8

40 CT + 20 AI + 40 interdisciplinary projects

~50%

Board paper competency share

Unchanged for 2026-27, with ~20% MCQ

What this means for you this week

You do not need to become an AI expert. You need one habit: before you do a repetitive teaching task by hand, ask whether a well-written prompt can give you a 70%-ready draft. This book gives you those prompts.

2. Your free AI toolkit in India, with real rupee prices

You can build a complete AI teaching workflow without spending a rupee. Everything below has a usable free tier, and the paid tiers are optional. Prices are the India prices as listed in late 2026 and include the numbers you would actually see at checkout.

The four tools that matter

ChatGPT is the workhorse for lesson plans, question papers and worksheets. Its free tier costs nothing and handles ordinary teaching drafts. If you hit the daily limits, ChatGPT Go costs Rs. 399 a month in India and gives you longer conversations and more image creation. ChatGPT Plus is Rs. 1,999 a month for heavier users. UPI works for Go and Plus. One warning about the past: the offer of twelve months of free ChatGPT Go in India ended on 21 January 2026, so do not expect it to be free now.

Google Gemini is the strongest option if you work in Indian languages or want AI inside Gmail and Docs. The best value in the country is the Jio offer: eligible Jio unlimited-5G users get Google AI Pro free for 18 months, a package Jio values at about Rs. 35,100. It includes higher access to Gemini's most capable model, five terabytes of storage, and expanded NotebookLM. If you are not on Jio, Google AI Plus is Rs. 399 a month and Google AI Pro is Rs. 1,950 a month.

NotebookLM is a research and study assistant from Google, free with a Google account. It is built for exactly one thing teachers need: point it at a document — a chapter PDF, your school's circular, a set of notes — and it answers questions grounded in that document, and can turn it into summaries and audio overviews. It is the safest tool for working from your own textbook, because it sticks to the source you gave it.

Bhashini is the Government of India's own language platform, run by MeitY under the National Language Translation Mission. It supports 22 scheduled Indian languages, it is free to use, and its Anuvaadini app translates text and documents. For a teacher who must send the same notice in Hindi, Tamil, Bengali or Marathi, it is the tool to reach for. Because it is a government public digital good, it is the most dependable free option for Indian-language work.

Tool	Free tier	Paid (India)	Best for
ChatGPT	Yes, Rs. 0	Go Rs. 399/mo; Plus Rs. 1,999/mo	Lesson plans, papers, worksheets
Google Gemini	Yes	AI Plus Rs. 399/mo; AI Pro Rs. 1,950/mo	Indian languages, Docs, Gmail

Tool	Free tier	Paid (India)	Best for
Gemini via Jio	Free 18 months (Google AI Pro)	Included with Jio 5G	Everything, plus 5 TB storage
NotebookLM	Yes, with Google account	Higher limits on Google AI Pro	Grounding in your own textbook
Bhashini	Yes, government, free	None	Translation into 22 Indian languages
DIKSHA	Yes, government, free	None	Official courses, AskDIKSHA

The smart free stack

ChatGPT Free for drafts + NotebookLM for anything based on your own textbook + Bhashini for translation + DIKSHA for official courses. That is a complete, zero-rupee teaching toolkit. Upgrade to a paid tier only when a limit genuinely blocks you, not before.

A word on DIKSHA and Shiksha Copilot

DIKSHA is India's national school-education platform, run by NCERT under the Ministry of Education. It works in 36 Indian languages, it is free, and it now carries an AI feature called AskDIKSHA that lets you query NCERT books in plain language. It is also where your official NISHTHA training lives, so it is worth knowing well.

Shiksha Copilot, built by Microsoft Research India with the Government of Karnataka, is a working example of a teacher-focused AI assistant. It generates lesson plans, activities, videos and quizzes grounded in the local curriculum for Classes 5 to 10, in Kannada and English, following the 5E model of Engage, Explore, Explain, Elaborate and Evaluate. It shows the standard you should hold your own AI outputs to: curriculum-grounded, editable, and under the teacher's control.

3. The four-part prompt formula that actually works

Almost every bad AI output in a classroom comes from one mistake: a vague prompt. If you type “give me a lesson plan for photosynthesis”, the AI has no idea which class you teach, which board you follow, or what your students already know. The output is generic, and you spend more time fixing it than you would have spent writing it.

The fix is a fixed four-part opening. Every prompt in this book uses it. Once you have used it ten times it becomes automatic.

The four parts, in order

- 1. Role.** Tell the AI who it is: “You are an experienced CBSE Class 8 Science teacher in India.”
- 2. Context.** Give the board, class, subject and the exact NCERT chapter or topic.
- 3. Task.** State precisely what you want produced — a lesson plan, a question paper, a worksheet, feedback.
- 4. Format.** Say how you want it: a table, numbered sections, a marking scheme, a word limit.

Two rules that raise quality further

- **Always name the chapter, not just the topic.** “NCERT Science Class 8, Chapter 5 — Coal and Petroleum” beats “coal”. Chapter numbers anchor the AI to your actual syllabus.
- **Ask for the draft, then refine in the same chat.** First ask for the plan. Then say “add scaffolding for weaker students and extension tasks for fast learners”. Then say “now give me five exit-ticket questions”. Three short turns beat one giant prompt.
- **Tell it what not to do.** “Do not copy questions directly from NCERT exercises” and “do not repeat questions” are prompt lines that measurably improve output.

A worked example, before and after

Weak prompt:

Give me a lesson plan for photosynthesis.

Strong prompt (the four parts):

You are an experienced CBSE Class 7 Science teacher in India. Create a 40-minute lesson plan for NCERT Science Class 7, Chapter 1 – Nutrition in Plants, focusing on photosynthesis. Include learning objectives, a 5-minute recap, a main explanation with one real-life Indian example, one hands-on activity using materials available in a typical government school, and 3 formative assessment questions. Format it as a table with a column for time.

The second prompt produces something you can teach from after a five-minute review. The first produces something you have to rewrite. The rest of this book is simply the strong version, written out for the tasks you do most.

4. The assessment vocabulary you need

AI writes better when you use the right words, and you grade better when you understand what the board is asking for. Here is the working vocabulary of Indian school assessment in 2026-27, in plain language.

Blueprint	The plan behind a paper: how many marks come from each chapter and each question type. Ask the AI for a blueprint and you get a paper that is balanced instead of front-loaded on one chapter.
Competency-based question	A question that drops the student into an unfamiliar situation and asks them to apply, analyse or justify — not to recall a fact. Roughly half of a board theory paper is now built this way.
Case-based / source-based question	A question built around a short passage, table, diagram or real-life scenario, with sub-parts that follow. In the board paper these sit in the final section.
Assertion-reason question	A pair of statements — an assertion and a reason — where the student decides whether the reason correctly explains the assertion. A fixture of Section A.
HOTS	Higher Order Thinking Skills: questions at the level of application, analysis and evaluation rather than memory. They carry good marks and separate the top students.
Step-wise marking	The CBSE habit of giving credit for each correct step — formula, substitution, calculation, unit — not only for the final answer. This is why a student who slips at the end still scores well.
Internal choice	Where a question offers an option, for example “answer any one of the two”. Asking the AI to add internal choice makes a paper fairer on a bad day.
Formative vs summative	Formative assessment is ongoing and diagnostic — quizzes, exit tickets, classwork. Summative is the final judgement — a unit test or board exam. AI is excellent at both.

Learning outcome	A precise statement of what a student should be able to do after a lesson. Anchor a lesson to an outcome and the AI can design a lesson that provably meets it.
Differentiated instruction	Teaching the same concept at different levels to different students. The three-version worksheet prompt (Prompt 26) is the practical way to do it.
5E model	A lesson structure: Engage, Explore, Explain, Elaborate, Evaluate. It is the model used by tools like Shiksha Copilot, and a good frame for any AI-generated plan.
Computational Thinking (CT)	Breaking a problem into small logical steps, spotting patterns and designing solutions a person or machine can follow. It is the foundation the new CBSE curriculum builds before AI.
AI literacy	Understanding what AI is, what it can and cannot do, and how to use it honestly and safely. This is now part of the curriculum from Class 6 upward.
Unplugged learning	Teaching a computing idea without any device — through games, paper puzzles and physical activity. The CBSE CT curriculum actively recommends it for primary classes.

Use the words in your prompts

When you write “include two case-based questions and one assertion-reason question, with step-wise marking”, the AI produces a paper that looks like the board's own. The vocabulary is the instruction.

5. Lesson planning: 10 prompts, hours to minutes

Lesson planning is the biggest weekly time sink for most teachers, and the easiest to hand off to AI. The rule is to ask for a first draft with your board, class and chapter named, then spend five minutes making it yours. Read the prompts below, replace the bolded details with your own, and run them.

1. The standard 40-minute lesson plan (CBSE)

You are an experienced CBSE teacher in India. Create a 40-minute lesson plan for [CLASS], [SUBJECT], NCERT Chapter [NUMBER] – [CHAPTER NAME]. Include: learning objectives, a 5-minute recap of prior knowledge, the main explanation with one real-life Indian example, one hands-on activity suitable for [NUMBER] students, a board-work summary, and 5 formative questions. Format it as a table with a Time column.

Swap CLASS, SUBJECT, chapter number and name. Works for any subject.

2. A week-at-a-glance plan

You are a [CLASS] class teacher in an Indian school. Build a one-week teaching plan for [SUBJECT] covering Chapters [X to Y]. For each of the five days, give: the sub-topic, the key concept to nail, a 10-minute activity, and a homework line. Present it as a table with one row per day.

3. The concept-first plan for a hard topic

You are an expert [SUBJECT] teacher. My [CLASS] students consistently find [TOPIC] difficult. Design a lesson that builds the idea from the ground up: start with what they already know, introduce one new idea at a time, include a common-misconception check, and end with a quick application question. Keep the language simple and give an Indian everyday example.

4. The 5E plan (Engage, Explore, Explain, Elaborate, Evaluate)

Design a lesson for [CLASS] [SUBJECT], Chapter [NUMBER] – [NAME], using the 5E model: Engage, Explore, Explain, Elaborate, Evaluate. For each stage give the teacher's action, the students' action, and the time in minutes. Total 40 minutes.

5. The activity bank

You are a resourceful Indian school teacher with limited lab equipment. Give me 8 low-cost, no-internet classroom activities for [CLASS] [SUBJECT], topic [TOPIC], using only materials found in an ordinary classroom (paper, chalk, bottles, everyday objects). For each, give the materials, the steps in 3 lines, and the concept it teaches.

6. The question-and-discussion plan

Prepare a Socratic discussion plan for [CLASS] [SUBJECT], topic [TOPIC]. Give 10 open questions that move from easy to challenging, one provocation question that will divide the class, and 3 lines on how to wrap up the discussion and land the key idea.

7. The revision lesson before a test

You are a [SUBJECT] teacher. I have one 40-minute period to revise Chapters [X to Y] for [CLASS] before a class test. Build a revision plan: a 5-minute rapid recall, a 15-minute guided practice of the 3 most exam-relevant question types, a 15-minute group quiz, and a 5-minute confidence check. Include the quiz questions with answers.

8. The substitute-teacher plan

I am leaving [CLASS] [SUBJECT] for one period with a substitute who does not know this subject well. Write a self-contained lesson for topic [TOPIC] that a non-specialist can run from the page: exact instructions, a reading passage, 5 questions, and a simple independent task. No external resources needed.

9. Align the plan to a learning outcome

Here is a learning outcome from my syllabus: [PASTE THE OUTCOME]. Design a 40-minute lesson for [CLASS] [SUBJECT] that provably achieves it. State at the start how you will know the outcome was met, and end with an exit ticket that checks exactly that outcome.

10. Turn a textbook page into a lesson

Here is the text of a textbook page: [PASTE TEXT]. Turn it into a 40-minute lesson for [CLASS]. Extract the 3 key concepts, write a simple explanation of each in student language, and add one activity and 5 questions. Do not introduce anything that is not in the text I gave you.

This is the safest prompt of all — the AI may only use the text you paste.

6. Question papers and assessments: 14 prompts

This is where AI saves the most time, and also where you must check the most carefully. Board papers for 2026-27 stay at roughly 50% competency-focused questions, about 20%

multiple-choice, and the rest short and long answers, with step-wise marking. The prompts below ask for that structure. Always compare the final paper against the official CBSE sample paper and marking scheme for your subject before you use it.

11. A full question paper to the CBSE blueprint

You are an experienced [SUBJECT] examiner for CBSE [CLASS]. Create a question paper for [CHAPTER/UNIT], total [MARKS] marks, in 3 hours. Follow the CBSE 2026-27 design: Section A objective (about 20%), Sections B and C short answer, Section D long answer, Section E case-based. Keep about half the paper competency-focused. Provide a complete marking scheme with step-wise value points.

Set MARKS to your school's pattern. Always cross-check with the official sample paper.

12. 20 MCQs with answer key

Generate 20 MCQs for CBSE [CLASS] [SUBJECT], Chapter [NUMBER] – [NAME]. Difficulty: 6 easy, 10 medium, 4 hard. Options must be A, B, C, D with one correct answer. Do not copy questions from NCERT exercises. Include 2 assertion-reason questions in the CBSE pattern, and give the answer key with a one-line reason each.

13. Competency-based and case-based questions

Write 5 competency-based questions and 2 case-based questions for [CLASS] [SUBJECT], Chapter [NAME], for the 2026-27 CBSE pattern. Each must drop the student into a real-life situation and require application or analysis, not recall. Provide the answer key with the reasoning and the marks breakdown.

14. The step-wise marking scheme

Here is a question worth [N] marks: [PASTE QUESTION]. Write the CBSE marking scheme for it: list every value point and the mark for each step, in the way an examiner would award credit. Show where a student who uses the right method but makes a small slip still earns marks.

15. A unit test for school exams

Create a 40-mark unit test for [CLASS] [SUBJECT] covering [TOPICS], to be finished in 90 minutes. Use the school-exam style: 10 one-mark, 5 two-mark, 4 three-mark, 1 five-mark. Include a marking scheme. Keep the language grade-appropriate for [CLASS].

16. The same paper at three difficulty levels

Create three versions of a 20-mark quiz on [TOPIC] for [CLASS]: an easy version for a mixed class, a standard version, and a challenge version for your top group. All three must test the same concepts so results are comparable. Provide answer keys for each.

17. Higher-order thinking (HOTS) questions

Write 8 HOTS questions for CBSE [CLASS] [SUBJECT], Chapter [NAME]. Each must require application, reasoning or evaluation – no direct recall. For each, give the thinking skill it tests (application, analysis, evaluation) and a model answer.

18. Numericals with worked solutions

Generate 10 numerical problems for [CLASS] [SUBJECT] on [TOPIC]. Range from direct formula use to two-step problems. For each, give the question, the formula, the substitution, the calculation and the final answer with correct units. Follow the CBSE step-wise credit style.

19. The unseen passage question set

Create a reading-comprehension question set for [CLASS] [SUBJECT] (language). Give a 250-word passage on an age-appropriate Indian topic, then 5 questions: 2 factual, 2 inference, 1 vocabulary. Include a marking scheme with value points and acceptable alternative answers.

20. The viva or oral assessment sheet

Prepare an oral assessment for [CLASS] [SUBJECT], topic [TOPIC]. Give 10 questions of increasing difficulty, the expected answer points for each, and a simple 5-point scoring rubric a teacher can use in two minutes per student.

21. The practical or project rubric

Design a project assessment for [CLASS] [SUBJECT] on [TOPIC]. Give: the project brief in student language, a timeline, and a 20-mark rubric across content, method, presentation and originality, with descriptors for each band. Keep it printable as one page.

22. A diagnostic test to find gaps

I want to find the learning gaps in my [CLASS] [SUBJECT] class before I start Chapter [NAME]. Create a 15-question diagnostic test covering the prerequisite skills, and a short guide on how to read the results – which wrong answers point to which gap.

23. Convert questions to the competency format

Here are 5 ordinary recall questions: [PASTE QUESTIONS]. Rewrite each as a competency-based question for the CBSE 2026-27 pattern, in a real-life context, testing application instead of memory. Keep the same underlying concept and give the answer key.

24. The full paper plus blueprint table

Create a question paper for [CLASS] [SUBJECT] on [UNIT] and, alongside it, a blueprint table showing how many marks come from each chapter and each question type, and the share of competency, MCQ and constructed-response questions. Aim for about 50/20/30.

7. A worked example: a full Class 10 Science paper

Here is how a prompt becomes a usable paper. The blueprint below is the kind of structure the AI returns when you ask for a CBSE-style paper with a blueprint table. Treat it as a template: your marks per chapter will differ, but the shape is right.

Step 1 — the blueprint

Ask: “Give me a blueprint for an 80-mark Class 10 Science paper covering Chapters 1 to 5, showing marks per chapter and per question type, with about 50% competency-based, 20% MCQ and 30% constructed response.” A good answer looks like this.

Section	Type	Marks	Share
A	Objective: MCQ + assertion-reason	16	20%
B	Very short answer (2 marks each)	12	15%
C	Short answer (3 marks each)	18	22%
D	Long answer (5 marks each)	20	25%
E	Case-based (4 marks each)	12	15%
E	Competency spread across sections	~40	~50%

Step 2 — a competency question, and why it works

Recall question: “What is the chemical formula of washing soda?” This tests memory only.

Competency question: “A shopkeeper uses washing soda to clean utensils. A student notices it feels slippery in water and turns red litmus blue. Identify the nature of the substance, write its chemical formula, and explain one more everyday use with a reason.” This tests application and reasoning, and carries three marks in the step-wise scheme.

Step 3 — the marking scheme

A real marking scheme gives credit step by step. For a three-mark numerical, the AI should return something like: formula 1 mark; correct substitution 1 mark; final answer with unit 1 mark. Ask for exactly this and check the total adds to the paper's marks.

The check you must always do

Open the official CBSE sample paper and marking scheme for your subject for 2026-27 on cbseacademic.nic.in and compare. CBSE has kept the paper design and assessment pattern unchanged this session, so the sample paper is your reference. Change any question that drifts outside your syllabus.

8. Worksheets and differentiated learning: 8 prompts

One class, three levels of learner. AI lets you produce a common worksheet and its easy and hard variants in the same sitting, which is exactly what differentiated teaching asks for and what no teacher has time to do by hand.

25. A standard worksheet with answer key

Create a worksheet for CBSE [CLASS] [SUBJECT], Chapter [NAME], for a 30-minute class. Include: 3 fill-in-the-blanks, 3 match-the-column, 4 short-answer and 2 application questions, on one printable page. Give the answer key separately at the end.

26. The differentiated set (easy, standard, challenge)

For [CLASS] [SUBJECT], topic [TOPIC], create three worksheets that teach the same concept at three levels: a scaffolded version for students who need support, a standard version, and an extension version with a challenge task. Each on one page, each with an answer key.

27. The concept-summary sheet

Summarise NCERT [CLASS] [SUBJECT], Chapter [NAME], into a one-page revision sheet: key definitions, 5 important points, a diagram described in words, and 3 common mistakes students make. Use simple language for a [CLASS] student.

28. The mixed-ability group task

Design a group activity for [CLASS] [SUBJECT], topic [TOPIC], for groups of 4-5 mixed-ability students. Give each group member a defined role, the task, and a way to make sure every member contributes. One page, no extra materials.

29. The remedial practice set

My [CLASS] students are weak in [SKILL, e.g. fractions]. Give a step-by-step practice ladder: start from the most basic prerequisite, move up in 6 small steps, with 3 practice questions at each step and a worked example. End with a short check.

30. The homework that does not need internet

Set homework for [CLASS] [SUBJECT], topic [TOPIC], that a student can complete at home with no internet and no textbook: 5 questions and one small observation or interview task linked to their everyday life.

31. The vocabulary or glossary builder

From NCERT [CLASS] [SUBJECT], Chapter [NAME], extract the 15 most important terms. For each, give a one-line student-friendly definition and a short example or use in a sentence. Present as a two-column glossary table.

32. The diagram-and-label practice

Create a diagram-practice worksheet for [CLASS] [SUBJECT], topic [TOPIC]. Describe the diagram in clear text so the student can draw it, list the parts to label, and add 4 questions on the labelled parts. Include a model answer description.

9. Grading, feedback and report cards: 6 prompts

Marking by hand is unavoidable, but writing comments for forty answer sheets is not. Use AI for the comment and feedback layer — never to assign the final mark blindly. You set the mark; the AI drafts the words. Read every comment before it reaches a parent.

33. Personalised feedback from a marking scheme

Here is a student's answer and the marking scheme: [PASTE ANSWER] [PASTE SCHEME]. Identify which value points the student hit and missed, explain in two friendly sentences what they did well and what to fix, and suggest one specific next step. Do not be harsh; be encouraging and specific.

34. Report-card remarks for a whole class

Write report-card remarks for a class of [NUMBER] students in [CLASS]. I will give you each student's strengths and one area to improve. Produce a 2-3 line remark per student that is warm, specific and different for each – no repeated sentences. Here are the notes: [PASTE].

35. Common-mistake analysis across a class

Here are the marks and common errors from my [CLASS] [SUBJECT] test: [PASTE]. Group the errors into the 4-5 most common mistakes, explain what each reveals about a gap in understanding, and give me one re-teaching action for each.

36. The rubric-based project feedback

Here is my project rubric: [PASTE RUBRIC]. Here is a student's project: [PASTE SUMMARY]. Give feedback against each rubric criterion, with a suggested band for each and one improvement per criterion. Keep the tone constructive.

37. The self-assessment sheet for students

Create a self-assessment sheet for [CLASS] [SUBJECT] on [TOPIC]. It should have 6 simple statements students tick (I can..., I need help with...), a space for one goal, and a short teacher comment box. One page.

38. Rewrite feedback in simpler language

Here is feedback I wrote: [PASTE]. Rewrite it so a [CLASS]-level student and their parent can understand it easily, in warm and simple English, without losing the specific point about what to improve.

10. Parent communication and admin: 6 prompts

Letters, notices, circulars and messages eat evenings. AI drafts them in seconds, and Bhashini translates them into the parent's language. Always read before you send — a circular with a wrong date is worse than no circular.

39. The parent notice for a test or event

Write a short, polite notice to parents of [CLASS] about [EVENT/TEST] on [DATE]. Include what parents need to do, what students should bring, and a line to contact the class teacher for questions. Keep it under 120 words, warm and clear.

40. The difficult-conversation message

Write a message to a parent about their child's [ISSUE, e.g. falling attendance / repeated missing homework]. Be respectful and non-accusatory, state the facts briefly, ask for a meeting, and offer one way the school can help. Under 100 words.

41. The progress update to a parent

Draft a short progress update to a parent about [STUDENT]'s performance in [SUBJECT] this month. Mention one clear strength, one specific area to work on, and one thing the parent can do at home. Warm, specific, under 90 words.

42. The circular to the whole school or class

Write a formal school circular for parents and students about [TOPIC, e.g. exam datesheet / PTM / holiday]. Use a clear heading, a short body with the key dates and instructions in bullet form, and a signature block for the Principal. One page.

43. Translate any message with Bhashini

Translate the following message into [LANGUAGE] in simple, natural wording a parent will understand, keeping the meaning exact and not adding anything: [PASTE MESSAGE].

Run this through Bhashini's Anuvaadini app for Indian languages; use this prompt in ChatGPT or Gemini for a first draft.

44. The meeting record and follow-up

I had a parent-teacher meeting about [STUDENT]. Here are my rough notes: [PASTE]. Turn them into a tidy meeting record with: what was discussed, what was agreed, who will do what by when, and a short follow-up message to send to the parent.

11. Teaching Computational Thinking & AI (Classes 3-8): 10 prompts

The CBSE CT and AI curriculum for Classes 3 to 8 is new this session, so you are building these lessons from scratch. That is exactly where AI is most useful: it helps you turn abstract ideas like pattern recognition or algorithmic thinking into games and unplugged activities that need no computers at all. These prompts map to the curriculum's own emphasis on unplugged learning and interdisciplinary projects.

45. An unplugged CT lesson (no computer)

Design a 40-minute unplugged Computational Thinking lesson for CBSE Class [3-5]. Teach [CONCEPT: decomposition / pattern recognition / algorithms / abstraction] through a game or physical activity using only paper, chalk or everyday objects. Give the steps, the discussion questions, and how to check understanding. No computers.

46. Explain AI to young students

Explain [AI CONCEPT: what AI is / how a chatbot answers / what training data is] to Class [3-5] students in language they understand. Use a simple Indian everyday analogy. Then give 3 questions to check they understood, and one activity to reinforce it.

47. An AI-literacy lesson for Classes 6-8

Create a 40-minute lesson for CBSE Class [6-8] on [TOPIC: rule-based classification / bias and fairness / how data drives decisions]. Include a real example, a short group discussion, and a hands-on activity where students sort or classify items by rules. Keep it ethical and simple.

48. A pattern-recognition activity set

For Class [3-5], create 6 pattern-recognition puzzles that get harder step by step, using shapes, numbers and everyday Indian objects. Give the puzzles, the answers, and the thinking skill each one builds.

49. The algorithm-writing worksheet

For Class [6-8], create a worksheet where students write step-by-step instructions (algorithms) for everyday tasks: making tea, packing a school bag, finding a book in a library. Include a worked example, 4 tasks, and a checklist students can use to test if their algorithm is clear.

50. The interdisciplinary project brief

Design an interdisciplinary project for CBSE Class [6-8] that combines [SUBJECT, e.g. Science] with Computational Thinking. It should run over 2-3 weeks (about 20 hours), solve a real problem in the local community, and end in a presentation. Give the brief, the milestones and a simple assessment rubric.

51. The ethics-of-AI discussion

Prepare a 30-minute discussion for Class [6-8] on responsible and ethical use of AI. Give a short scenario students can debate, 6 discussion questions, and the key ideas to land: fairness, honesty about AI use, checking facts, and privacy.

52. Assessment for the CT & AI class

Create an assessment for CBSE Class [6-8] CT and AI on [TOPIC]. Include 5 multiple-choice questions, 2 short activities and 1 project-style question, with a marking scheme. Keep it about understanding, not memorisation.

53. The teacher's own refresher on a CT idea

Explain [CT CONCEPT: decomposition / abstraction / algorithmic thinking / pattern recognition] to me, a school teacher with no computer-science background, in plain language with one classroom example. Then list the 3 misconceptions my students are likely to have about it.

54. A no-internet, no-device AI-awareness talk

Write a 15-minute assembly talk for students of Classes 6-8 on using AI honestly and safely – what it can and cannot do, why you must check its answers, and why copying AI work without understanding is cheating yourself. Warm and age-appropriate.

12. Multilingual classrooms with Bhashini: 6 prompts

Many of your students and their parents think in a language other than English, and a good teacher meets them there. Bhashini, the Government of India's language platform, supports 22 scheduled Indian languages for free. Use these prompts to produce the same lesson or message in the language your classroom actually speaks.

55. Translate a lesson summary for students

Translate this lesson summary into simple [LANGUAGE] for Class [CLASS] students, keeping the meaning exact and the language at their level. Do not add or remove any content: [PASTE SUMMARY].

Run through Bhashini Anuvaadini for accuracy.

56. The bilingual worksheet

Create a worksheet for [CLASS] [SUBJECT], topic [TOPIC], with each instruction and question in both English and [LANGUAGE], side by side. Keep the content identical in both languages and the wording simple.

57. Explain a concept in the home language

Explain [TOPIC] to a [CLASS] student in [LANGUAGE] in 150 words, using an everyday example they will recognise, then repeat the same explanation in simple English below it.

58. The parent message in two languages

Write a short message to parents about [TOPIC] in both English and [LANGUAGE]. Keep it under 100 words in each, and make sure both versions say exactly the same thing.

59. Glossary for a bilingual class

Give me a 20-term glossary for [CLASS] [SUBJECT], Chapter [NAME], with each term in English and its standard [LANGUAGE] equivalent. Present it as a table I can print.

60. Adapt a question paper to the medium of instruction

Here is a question paper: [PASTE]. Translate every question into [LANGUAGE] for a [LANGUAGE]-medium section, keeping the numbering, marks and difficulty exactly the same. Return it in the same layout.

13. Subject-by-subject: what AI does best for each

The same tools behave differently across subjects. Use these notes to reach for the right prompt first.

Science (Classes 6-12)

AI is strongest here for numericals with worked solutions, labelled-diagram descriptions, and converting textbook experiments into competency questions. It is weakest at original data — never let it invent an experimental result. Use Prompt 8 for numericals and Prompt 13 for competency conversion.

Mathematics

Ask for step-wise solutions and for three difficulty levels of the same problem set. AI is very good at generating fresh practice problems, which is exactly what a maths teacher runs out of. Always check every calculation by hand; this is the one subject where a silent arithmetic error can slip through. Use Prompts 8, 26 and 30.

Social Science and History

AI shines at turning events into source-based questions with a short passage, at building timelines, and at writing balanced compare-and-contrast questions. Ask it to keep facts to the NCERT text and to avoid contested claims. Use Prompts 14, 15 and 27.

English and Languages

Use it for unseen passages, grammar drills, writing-task prompts (letter, article, notice) and vocabulary glossaries. For literature, ask for question sets that reward textual evidence, matching the board's emphasis on quoting from the passage. Use Prompts 19, 31 and 32.

Commerce, Economics and Humanities

AI is good at case studies, format-based questions (balance sheet, journal entries) and data-interpretation tasks. Ask it to follow the exact board format and to include a working note. Use Prompts 11, 16 and 21.

Primary and Preparatory (Classes 3-5)

Keep it unplugged and playful. Use AI for activity banks, pattern puzzles and simple explanatory analogies, and for the CT curriculum that is now embedded in the subjects. Use Prompts 5, 45 and 48.

One rule across every subject

The AI drafts; you verify. In maths check the arithmetic, in science check the formulae, in languages check the register, and in social science check the facts. Your subject expertise is the quality control that no tool can replace.

14. Growing your own career with AI

The teachers who learn this early do not just save time. They become the person in the school others ask for help — and that has real career value.

Use the free official training

DIKSHA hosts more than 350 live courses, about 59 of them on AI and digital learning, and NISHTHA carries dedicated AI-in-education modules. These are free, government-run, and come with certificates. Completing them is the fastest way to be credible on AI in your school, and they are the official route the Ministry has built for exactly this shift.

Build a portfolio of your AI-assisted work

Keep a folder of the lesson plans, question papers, worksheets and rubrics you build with these prompts. Over a term you will have a personal resource bank that saves you even more time next year, and it is evidence you can show in an appraisal or an interview. A teacher with a ready-made, curriculum-aligned resource bank is a valuable teacher.

Become the local resource person

Once you are comfortable, run a short session for your colleagues on the four-part prompt formula and the free tools. Sharing two or three prompts that save an hour a week is easy to do and makes you the go-to person. CBSE and NCERT also invite teachers to contribute content and to act as resource persons; a track record of good digital material helps.

Stay current without drowning

You do not need to follow every AI announcement. Follow your board — the CBSE academic website and the PIB education releases — and check the sample papers each September. Two habits, thirty minutes a month, keep you ahead of the curve without the noise.

The bigger point

AI will not replace teachers. It will widen the gap between teachers who use it well and teachers who do not. Learning it now, while it is still early, is the cheapest career investment you can make.

15. The seven rules of responsible use

The government's own guidance on teacher-facing AI is clear on one point: the teacher stays central, and AI output is a suggestion to be finalised by your judgement. These seven rules keep you safe, keep your students safe, and keep your name off a mistake.

- 1 Check every fact before it reaches a student.** AI occasionally gets formulae, dates, chapter sequences and definitions wrong. If it is going into a lesson or a paper, verify it against your NCERT textbook or the official CBSE material. Treat the AI as a knowledgeable colleague who sometimes needs fact-checking, not as a source.
- 2 Keep the teacher in the loop.** AI drafts; you decide. Never hand an AI-generated paper, worksheet or comment to students without reading it. Your subject expertise is what turns a draft into a good lesson.
- 3 Never paste personal student data.** Do not type a student's name, marks, health details or family information into a public AI tool. Use initials or "Student A". For anything based on your own textbook, prefer NotebookLM, which works from the document you give it.
- 4 Tell students the rules on AI and honesty.** Explain plainly that copying AI answers without understanding is cheating themselves. Encourage students to verify, question and explain their thinking — the exact habits the competency-based paper rewards.

- 5 Check the board's current requirements.** Syllabus, marks and question patterns can change. Cross-check against the latest CBSE sample paper, marking scheme and circular for your subject and class before you build a paper.
- 6 Watch the language limits.** AI is strongest in English. For Indian-language content, use Bhashini, and have a colleague who speaks the language read the output before it is printed.
- 7 Give it your judgement, not just your data.** The classroom context — which students are weak in what, what happened yesterday — only you know. Add that context in one line to every prompt. That is what makes the output fit your class rather than a generic one.

16. The 30-day rollout plan

Do not try to change everything at once. This is a four-week plan that takes you from setup to a full AI-assisted workflow, about twenty minutes a day.

Week 1	Set up and try one thing. Create your free accounts (ChatGPT, NotebookLM, and Bhashini or the Jio Gemini offer). Pick one class and one subject. Use prompts 1 and 2 to draft a single week of lesson plans. Compare the AI draft with how long you normally take. Do not use AI for anything else this week.
Week 2	Add assessments. Use prompts 11, 12 and 13 to build one question paper and one MCQ set for the same class. Check every question against your textbook and the official sample paper. Notice how much of the paper is ready to use.
Week 3	Add worksheets and feedback. Use prompts 25 and 26 to make a differentiated worksheet set, and prompts 33 and 34 to draft feedback for one class's answer sheets. Set your own marks first, then let the AI write the words.
Week 4	Add communication and CT & AI. Use prompts 39 and 40 for a parent notice, translate it with Bhashini using prompt 43, and run prompt 45 or 47 to plan your first Computational Thinking or AI lesson. By now you have a full workflow.

The one habit that matters

Before any repetitive task — a lesson plan, a paper, a set of comments — ask: could a good prompt give me a 70% draft in two minutes? If yes, prompt first, then edit. That single habit is the whole playbook.

17. Troubleshooting and FAQs

The output is generic and not useful. What am I doing wrong?

You are almost certainly missing the context. Add the board, the class, the exact NCERT chapter number and the format you want. Compare your prompt with the four-part formula in Chapter 3 and with any prompt in this book.

Do I need a paid subscription?

No. The free tiers of ChatGPT and Gemini, plus NotebookLM, Bhashini and DIKSHA, are enough for a full teaching workflow. Pay only if a daily limit genuinely blocks you. The Jio Google AI Pro offer is free for 18 months for eligible Jio 5G users and is the best value if you want more.

The AI got a fact wrong. Should I stop using it?

No — but always check facts against your textbook before students see them. AI is a drafting tool, not an authority. Rule 1 in Chapter 15 is the one to remember.

Can I use AI for board-exam question papers?

Use it to draft, then check every question against the official CBSE sample paper and marking scheme for your subject. CBSE has kept the 2026-27 paper design and assessment pattern unchanged, so the sample papers are your reference.

Is AI-generated content allowed in CBSE assessments?

For school-level assessments, the content is at the teacher's discretion as long as it aligns with the NCERT and CBSE syllabus. What matters is that you review it. Always follow your school's own policy.

My students' parents speak a different language. How do I reach them?

Use Bhashini, the government's free platform, to translate notices and messages into any of 22 Indian languages. Write the message in English first, then translate, then have someone read it once before you send.

How do I teach AI when I do not know AI myself?

You do not need to be an expert. The CBSE curriculum for Classes 3-8 is built on unplugged, everyday activities like patterns and step-by-step instructions. Prompts 45 to 54 in this book plan those lessons for you, and DIKSHA carries free official training.

Will AI replace teachers?

No. It removes the repetitive paperwork — drafting, formatting, first-pass feedback — so you have more time for the part that only a human can do: explaining a hard idea, spotting a struggling student, and reading the room.

Appendix A. Set up in 10 minutes

You can be running prompts by the end of this page. Do these five steps once, and you are set up for the year.

- 1 Create a Google account.** One account gives you Gemini, NotebookLM and Google Docs. If you already have Gmail, you are done. This is the account to use for school work.
- 2 Create a ChatGPT account.** Go to chatgpt.com and sign up. The free tier is enough to start. If you are on Jio 5G, claim the Google AI Pro offer from the MyJio app for higher Gemini limits.
- 3 Bookmark Bhashini.** Open bhashini.gov.in and try the Anuvaadini app with one short sentence. This is your translation tool for 22 Indian languages, and it is free.
- 4 Install the DIKSHA app.** Download DIKSHA from the Play Store or App Store. It carries your official NISHTHA training and the AskDIKSHA feature that answers questions from NCERT books.
- 5 Set your privacy habits now.** Never type a student's real name, marks or personal details into a public AI tool. Use "Student A". For anything based on your own textbook, use NotebookLM, which works only from the document you give it.

The 30-second test

After setup, paste Prompt 1 into ChatGPT with your own class, subject and chapter. If you get a usable lesson plan in under a minute, your setup is complete.

Appendix B. Working with limited internet and shared devices

Many Indian classrooms run on patchy internet, one shared device, or a single teacher's phone. That does not stop you from using AI. The trick is to do the AI work before the

class, save the output, and teach from the saved file.

Do the AI work before you need it

Plan and generate your lesson plans, papers and worksheets when you have a signal — at home or in the staff room — then save each as a PDF or Word file on your phone. In class, you teach from the saved file. No internet needed at the moment of teaching.

Use the offline features that already exist

NotebookLM can turn a document into an audio overview you can listen to on the way to school. DIKSHA lets you store and share content offline, and its QR-coded textbooks work without a live connection. Download what you need in advance and the classroom never depends on the network.

On a shared device, keep it clean

If you share a computer or phone, sign out of your AI accounts when you finish, and use temporary chat so your conversations are not saved. Never leave student information on a shared device.

Save data when it is metered

Ask for text output, not images, when your data is limited. Copy the text into your phone's notes or a Word file. A page of text costs almost nothing; generating and downloading images does not.

The rule of thumb

AI is a preparation tool, not a live-classroom tool. Prepare on a good connection, save the output, and teach from it. That works even in a school with no Wi-Fi at all.

Appendix C. AI for your own admin, records and school duties

Teaching is only half the job. The other half is circulars, rosters, records, reports and meetings. These six prompts handle the paperwork so you can spend the time on students.

61. Attendance and record remarks

Write tidy, neutral remarks for my class register for these situations: [PASTE SITUATIONS, e.g. repeated late arrival, long absence, good improvement]. Keep each to one line, factual and professional, with no personal judgement.

62. The invigilation and exam-duty note

Draft a clear note for teachers about exam duty for [EXAM] on [DATES]. Include the reporting time, the room allocation method, what to carry, and the rules to announce to students. Formal but simple.

63. A draft timetable

Help me draft a weekly timetable for [CLASS/SCHOOL] with [NUMBER] periods a day and subjects [LIST]. Balance the heavy subjects across the week and avoid placing two demanding subjects back to back. Present it as a table.

64. The parent-teacher meeting plan

Plan a parent-teacher meeting for [CLASS]. Give: a 45-minute agenda, what to prepare, how to keep each parent conversation to 5 minutes, and a short opening script. Include a checklist of documents to keep ready.

65. Minutes of a staff meeting

Here are my rough notes from a staff meeting: [PASTE]. Turn them into proper minutes with attendees, agenda items, decisions taken, action points with owners and deadlines, and the date of the next meeting.

66. The letter to the education department or board

Draft a formal letter from [SCHOOL] to [AUTHORITY] about [SUBJECT, e.g. requesting resources / reporting an event / applying for recognition]. Use an official tone, a clear subject line, numbered points where needed, and a signature block.

Appendix D. The weekly rhythm and a printable planner

The teachers who get the most out of AI do not use it randomly. They build it into a weekly rhythm, so the drafting happens at fixed times and never piles up. Here is a rhythm that fits around a normal teaching week.

When	Task	Prompts to use	Time
Sunday evening	Plan the week's lessons	1, 2, 3	20 min
Monday	Build this week's worksheets	25, 26, 27	15 min
Wednesday	Draft any test or quiz	11, 12, 13	20 min
Thursday	Parent messages and notices	39, 40, 43	10 min
Friday	Feedback and report remarks	33, 34	20 min
Monthly	CT & AI lesson and career growth	45, 47, 60	30 min

A one-page planner you can copy into a notebook

Each week, fill one row. Keeping it on paper makes the habit stick, and at the end of a term you have a record of everything AI helped you build.

Week	Class / Subject	What I drafted	Time saved (my estimate)
1			
2			

Week	Class / Subject	What I drafted	Time saved (my estimate)
3			
4			
5			

Why the rhythm matters

AI saves time only if you reach for it at the right moment. A fixed weekly rhythm removes the decision, so drafting becomes automatic rather than something you remember to do.

Appendix E. 12 bonus prompts for the teacher's own work

Beyond lessons and papers, these prompts cover the rest of a teacher's week — guidance, events, writing and reflection. They bring the library to seventy-two prompts in total.

67. Career guidance for a student

A [CLASS] student is interested in [FIELD] and is good at [STRENGTH]. Suggest 3 realistic career paths in India for them, the entrance exams or courses each needs, and one thing they can do this month to start. Keep it honest and encouraging.

68. A notice for a co-curricular event

Write an announcement for students about [EVENT, e.g. science fair / debate / sports day]. Include what it is, the date, who can take part, how to register, and the prizes. Short, lively and clear.

69. The annual-day or assembly script

Write a short anchoring script for a school assembly or annual day on the theme [THEME], for [NUMBER] minutes. Include a welcome, transitions between items, and a closing. Keep the language simple and warm.

70. A school-magazine write-up

Write a 300-word article for our school magazine on [TOPIC]. Make it engaging for students and parents, with a clear opening, two or three points, and a closing thought. Simple, non-preachy English.

71. The WhatsApp message for the class group

Write a short, friendly WhatsApp message to the [CLASS] parent group about [TOPIC]. Under 60 words, one clear action, polite tone, no jargon. Include a line asking them to acknowledge.

72. A circular about a holiday or change

Write a school circular informing parents and students about [CHANGE, e.g. holiday / revised timings / exam postponement]. State the change, the reason in one line, and what stays the same. Formal and brief.

73. Study-skills advice for students

Write a one-page guide for [CLASS] students on how to study for [SUBJECT] effectively: how to make a revision timetable, how to use past papers, and 3 common mistakes to avoid. Simple, practical, no lectures.

74. A pep talk for an exam batch

Write a short, sincere message for my [CLASS] students before their board or school exams. Acknowledge their effort, give 3 practical last-week tips, and calm their nerves. Warm and human, about 120 words.

75. Your own reflection and self-appraisal

Help me write a reflective note for my annual self-appraisal. Here are the things I did this year: [PASTE]. Turn them into a professional, honest reflection with achievements, challenges, and goals for next year.

76. A reading list for the class library

Suggest 10 age-appropriate books for a [CLASS] class library in India, mixing Indian and international authors, fiction and non-fiction. For each, give one line on why it suits this age and what it teaches.

77. An inclusive-classroom adjustment

One of my students has [NEED, e.g. low vision / difficulty reading / a hearing aid]. Suggest 5 practical, low-cost adjustments I can make in a normal Indian classroom to help them learn alongside everyone else. Respectful and specific.

78. Prepare for an inspection or audit

Help me prepare for a school inspection. List the records and documents a [CLASS] class teacher should keep ready, a short checklist to review them, and 5 questions an inspector is likely to ask, with brief answers.

Appendix F. The ten most common prompt mistakes, and the fix

Nearly every disappointing AI output traces back to one of these ten mistakes. Learn them once and your output quality jumps immediately.

Mistake	What you get	The fix
You gave no class or board	Generic content that fits nobody	Name the board, class and subject in the first line

Mistake	What you get	The fix
You named a topic, not a chapter	Wrong depth, missed syllabus points	Add the NCERT chapter number and name
You asked for everything at once	A shallow pass at each thing	Ask for the plan, then refine in follow-up turns
You did not say the format	A wall of text you must reformat	Say “as a table with a Time column” or “numbered sections”
You did not say what to avoid	Repeated or textbook-copied questions	Add “do not repeat” and “do not copy NCERT exercises”
You accepted the first draft	80% ready, 20% wrong	Ask for scaffolding, extension and an answer key next
You trusted the facts	A wrong formula or date slips through	Check every fact against your textbook before use
You pasted student names	A privacy risk	Use “Student A”, or use NotebookLM with your own document
You used one tool for everything	Weak Indian-language or textbook work	Bhashini for languages, NotebookLM for your own text
You gave up after one try	You think AI does not work	Reword once with the four-part formula; quality is a function of the prompt

The pattern behind all ten

AI output is a mirror of the prompt. Add role, context, task and format, and you get a usable draft. Leave them out, and you get filler.

Appendix G. A complete lesson plan, generated

This is what Prompt 1 returns when it is used well — a full 40-minute plan for CBSE Class 8 Science, Chapter 5 (Coal and Petroleum), produced with the four-part formula and then lightly edited. Use it as the standard you hold your own outputs to.

Time	Stage	Teacher does	Students do
0-5 min	Recap	Ask 3 quick questions on exhaustible resources from the last chapter	Answer orally; connect to today's topic
5-12 min	Explain	Explain how coal formed from dead vegetation over millions of years; use the example of coal fields in Jharkhand	Listen, note key points, ask questions
12-22 min	Activity	Divide the class into groups; give each a chart to sort items into exhaustible and inexhaustible	Sort the items and justify one choice per group
22-32 min	Explain	Explain petroleum refining and list its products: LPG, petrol, diesel, kerosene, lubricants	Match each product to a common use at home
32-38 min	Check	Ask the 3 formative questions below; correct misconceptions on the spot	Answer individually on paper
38-40 min	Close	Summarise; set homework from the worksheet	Note the homework

Learning objectives

- Explain the difference between exhaustible and inexhaustible resources.
- Describe how coal was formed and name two of its uses.
- List at least four products obtained from refining petroleum.

Formative questions (used in the check stage)

- ¹ Why is coal called an exhaustible resource?
- ² Name two products we get from petroleum and one use of each.
- ³ A friend says petrol and diesel are the same. Correct them in one sentence.

What to do with this example

This is a draft, not a script. Add your own class's context — which students need the activity explained twice, which local example will land best — and it becomes your lesson. That five-minute personal edit is what makes AI-assisted teaching good teaching.

Appendix H. Myths about AI in Indian classrooms, and the reality

A lot of what teachers hear about AI is either hype or fear. Here is the honest version.

What you hear	The reality
"AI will replace teachers."	It removes the paperwork — drafting, formatting, first-pass feedback. The parts that need a human, explaining a hard idea and reading a struggling student, matter more, not less.
"You have to pay for good AI."	The free tiers of ChatGPT and Gemini, plus NotebookLM, Bhashini and DIKSHA, cover a full teaching workflow. The Jio Google AI Pro offer is free for 18 months for eligible Jio 5G users.
"AI already knows my syllabus."	It does not. It can drift outside your chapter or miss a syllabus point. Always name the NCERT chapter and check the output against the textbook.
"AI is only useful for tech teachers."	Language teachers get passages and grammar drills, social-science teachers get source-based questions, primary teachers get activity banks and the new CT curriculum. Every subject benefits.
"Using AI to prepare is cheating."	Using AI to prepare your teaching is exactly what the system now encourages through NISHTHA and DIKSHA. Cheating is a student submitting AI work without understanding it — a different thing, and one you should discuss openly with your class.
"AI only works well in English."	Bhashini, the government's own platform, handles 22 Indian languages for free. Gemini is also strong in Indian languages.
"I am too old or not technical enough."	If you can send a WhatsApp message, you can write a prompt. It is plain typing, and this book has already written seventy-eight of them for you.
"AI gives you the final answer."	It gives you a first draft, fast. Your judgement turns that draft into a lesson. That is the whole point.

Official resources to bookmark

These are the only sources you need to stay current. All are free and government-run except the AI tools themselves.

cbseacademic.nic.in	Sample papers and marking schemes for Classes X and XII, the CT and AI curriculum for Classes 3-8, and the students' and teachers' handbooks.
cbse.gov.in	Official circulars, the marking-scheme page, and assessment notices. This is where a change in the exam pattern would appear first.
diksha.gov.in	The national school-education platform. Free official courses including NISHTHA, and the AskDIKSHA feature that answers from NCERT books.
ndear.gov.in	The National Digital Education Architecture, the blueprint behind DIKSHA and state platforms.
bhashini.gov.in	The government's language platform and the Anuvaadini translation app, covering 22 Indian languages, free.
ncert.nic.in	Official textbooks and the National Curriculum Framework for School Education 2023.
pib.gov.in	Official press releases from the Ministry of Education, including every announcement about the AI and CT rollout.

A closing word

The change in Indian school education this year is real, and it arrived faster than most of us expected. But the tools are free, the training is free, and the only new skill you need is the habit of asking well. You already do the hardest part of this job every single day. Let AI carry the paperwork, and keep the teaching for yourself. Start with one prompt today — the lesson plan for tomorrow — and you will wonder why you did it by hand for so long.

Appendix I. The one-page cheat sheet

Print this page and keep it on your desk. It is the whole playbook in one glance.

The four-part formula

Part	What to write	Example
1. Role	Who the AI should be	"You are an experienced CBSE Class 8 Science teacher."
2. Context	Board, class, subject, chapter	"NCERT Science Class 8, Chapter 5 — Coal and Petroleum."
3. Task	Exactly what to produce	"Create a 40-minute lesson plan."
4. Format	How you want it	"As a table with a Time column and an answer key."

The twelve prompts worth memorising

- 1 Lesson plan: "You are a CBSE [class] [subject] teacher. 40-min plan for Chapter [no], with objectives, activity, 5 questions, as a table."
- 2 Question paper: "CBSE [class] [subject] paper, [marks] marks, Sections A-E, ~50% competency, with step-wise marking scheme."

- 3 MCQs: "20 MCQs for Chapter [no], 6 easy/10 medium/4 hard, 2 assertion-reason, with answer key."
- 4 Competency: "5 competency and 2 case-based questions for [topic], real-life context, with reasoning and marks."
- 5 Worksheet: "One-page worksheet for Chapter [no], 3 fill-ins, 3 match, 4 short, 2 application, with answer key."
- 6 Differentiated: "Three worksheets on [topic] — scaffolded, standard, extension — with keys."
- 7 Feedback: "Here is a student answer and the marking scheme. Say what they hit and missed, in two friendly sentences."
- 8 Report remarks: "Write 2-line report remarks for each student from these notes, warm and different for each."
- 9 Parent notice: "Short polite notice to parents about [event] on [date], under 120 words."
- 10 CT lesson: "Unplugged 40-min Computational Thinking lesson for Class [3-5] on [concept], no computers."
- 11 Translate: "Translate this into [language], simple and exact, adding nothing" (run through Bhashini).
- 12 Explain AI: "Explain [AI concept] to Class [6-8] with an Indian everyday analogy and 3 check questions."

The seven rules, in one line each

- Check every fact before it reaches a student.
- Keep the teacher in the loop — AI drafts, you decide.
- Never paste personal student data.
- Tell students the rules on AI and honesty.
- Check the board's current requirements.
- Watch the language limits — use Bhashini, then have a colleague read it.
- Add your classroom context in one line to every prompt.

Quick prompt index

All seventy-eight prompts in one place, so you can find the one you need in seconds.

Lesson planning	Prompts 1-10
Question papers and assessments	Prompts 11-24
Worksheets and differentiated learning	Prompts 25-32
Grading, feedback and report cards	Prompts 33-38
Parent communication and admin	Prompts 39-44
Teaching Computational Thinking & AI (Classes 3-8)	Prompts 45-54
Multilingual classrooms with Bhashini	Prompts 55-60
Bonus admin and duty prompts (Appendix C)	Prompts 61-66
Bonus prompts: guidance, events and reflection (Appendix E)	Prompts 67-78

Your three prompts to memorise

Prompt 1 (lesson plan), Prompt 11 (question paper) and Prompt 33 (feedback). Between them they cover the work that eats most of your week. Once these three are automatic, add the rest.

Sources and verification

Every fact in this playbook was checked against the official sources below before publication. Where a figure could change, the date of the source is given. Verify current requirements with your school and board before acting on any date or pattern.

CBSE Computational Thinking & AI curriculum, Classes III-VIII, 2026-27	Press Information Bureau, Ministry of Education, 1 April 2026; CBSE Circular Acad-15/2026
CT & AI time allocation and framework	CBSE curriculum document, CTAI Classes 3-8, 2026-27 (cbseacademic.nic.in)
Class IX AI courses discontinued; NCERT modules for Classes 9-12	CBSE Circular Acad-18/2026, 9 April 2026
NISHTHA AI modules; DIKSHA course numbers	Press Information Bureau, Ministry of Education, 29 July 2026
AI & CT from Grade 3; teacher training through NISHTHA	Press Information Bureau, 30 October 2025
DIKSHA platform, 36 languages, AskDIKSHA	diksha.gov.in; NCERT/CIET
Shiksha Copilot, 5E model, Classes 5-10	Government of Karnataka and Microsoft Research India
Teacher-facing AI and human-in-the-loop guidance	Observer Research Foundation, July 2026
CBSE assessment pattern 2026-27 unchanged; ~50% competency, ~20% MCQ	CBSE sample-paper notices, September 2026; CBSE circulars Acad-45/2023 and Acad-30/2024
ChatGPT India prices	OpenAI pricing and India pricing trackers, September 2026
Google Gemini free with Jio; Google AI Pro value and features	Jio official offer page; Google
Bhashini, National Language Translation Mission, 22 languages	bhashini.gov.in; Ministry of Electronics and Information Technology
